

COLDNet Profile – Adding Aerial Points

Adding Aerial Points

Aerial points can also be manually added after the survey data has been imported and the profile has been generated. This can be done from the Profile Form by right-clicking on the elevation view near the location in which you would like to generate an aerial point and select **Add Aerial Point**.

A **Chainage** will automatically be populated from the location of the right mouse-click but can be manually updated to the exact location required. Enter a **Height Above Ground** and **Comments** if required before selecting **Save Aerial Point**. Make sure **Comments** are turned on under the **Visuals** window if you wish to view the aerial point comments.
